Companies
Hint
You are given an array of integers nums and an integer target, return indices of the two numbers such that they add up to target.
You may assume that each input would have exactly one solution, and you may not use the same element twice.
You can return the answer in any order.
Example 1:
Input: nums = [2,7,11,15], target = 9
Output: [0,1]
Explanation:
The sum of nums[0] and nums[1] is 2 + 7 = 9, which equals the target. Therefore, the indices [0, 1] are returned.
Example 2:
71.1K
2.2K
Code
Note
C++
Auto
#include <unordered_map>
using namespace std;
class Solution {
public:
vector<int> twoSum(vector<int>& nums, int target) {
// Map to store: number -> its index
unordered_map<int, int> numMap;
for (int i = 0; i < nums.size(); i++) {
int complement = target - nums[i];
// Check if complement already exists in map
if (numMap.find(complement) != numMap.end()) {
return {numMap[complement], i};
}
// Store current number and its index
numMap[nums[i]] = i;
}
return {};
}
